Unlocking the Postgres Lock Manager

BRUCE MOMIIAN

This talk explores all aspects of locking in Postgres by showing queries and their locks; covered lock types include row, table, shared, exclusive, and advisory lock types.

No One Likes Locking But it Is Necessary for Proper Database Operation

Outline

- 1. Locking Introduction
- 2. Transaction Identifiers
- 3. Lock Types
- 4. Lock Examples

Introduction

http://ashleyhatfield.com/wp-content/uploads/2010/08/construction-stop-sign.jpg

What an Adventure! Xyzzy

MVCC

Multiversion Concurrency Control (MVCC) allows Postgres to offer high concurrency even during significant database read/write activity. MVCC specifically offers behavior where "readers never block writers, and writers never block readers".

While Multiversion Concurrency Control (MVCC) reduces locking requirements, it does not eliminate locking.

Transaction Identifiers

http://www.ridelust.com/wp-content/uploads/traffic_lights_mist.jpg

Keep Your Eye on the Red (Text)

http://www.eyeshadowlipstick.com/wp-content/uploads/2011/02/cat-eye-red-lips.jpg

What Is Our Process Identifier (PID)?

```
SELECT pg_backend_pid();
pg_backend_pid
-----
11306
(1 row)
```

All the queries used in this presentation are available at http://momjian.us/main/writings/pgsql/locking.sql.

What Is Our Virtual XID (VXID)

2 is the backend id, and 7 is the virtual transaction id for this backend, i.e. backend id/backend-local xid.

What Is Our Backend Id?

```
SELECT *
FROM pg_stat_get_backend_idset() AS t(id)
WHERE pg_stat_get_backend_pid(id) = pg_backend_pid();
id
----
2
(1 row)
```

The maximum backend id is set by *max_connections*.

Query courtesy of Phil Sorber.

The VXID Increments

```
SELECT virtualtransaction AS vxid, transactionid::text
FROM pg locks
WHERE pid = pg_backend_pid()
ORDER BY 1, 2
LIMIT 1;
vxid | transactionid
2/10
(1 row)
SELECT virtualtransaction AS vxid, transactionid::text
FROM pg_locks
WHERE
       pid = pg_backend_pid()
ORDER BY 1, 2
LIMIT 1;
vxid | transactionid
2/11
(1 row)
```

Getting a Real/External/Non-Virtual XID

```
BEGIN WORK;
BEGIN
SELECT virtualtransaction AS vxid, transactionid::text
FROM pg locks
WHERE pid = pg backend pid()
ORDER BY 1, 2
LIMIT 1;
 vxid | transactionid
2/12
(1 row)
ANALYZE pg language;
ANALYZE
```

Getting a Real/External/Non-Virtual XID

```
SELECT virtualtransaction AS vxid, transactionid::text
FROM pg locks
WHERE pid = pg backend pid()
ORDER BY 1, 2
LIMIT 1;
vxid | transactionid
2/12 | 674
(1 row)
SELECT txid current();
txid current
          674
(1 row)
COMMIT:
COMMIT
```

Transaction identifiers range from 3 to 4 billion (2 ^ 32). Zero(0) is an invalid transaction id, and 1 and 2 are used for setting frozen xids (*committed* and *aborted*).

Requesting Your XID Assigns One

```
BEGIN WORK;
BEGIN
SELECT virtualtransaction AS vxid, transactionid::text
FROM
       pg locks
WHERE
        pid = pg backend pid()
ORDER BY 1, 2
LIMIT 1;
vxid | transactionid
2/13
(1 row)
-- this will assign a non-virtual xid if not already assigned
SELECT txid current();
txid current
          675
(1 row)
```

Requesting Your XID Assigns One

Lock Types

Hohenzollern Bridge

Setup: Create View lockview

```
-- cannot be a temporary view because other sessions must see it
CREATE VIEW lockview AS
SELECT pid, virtualtransaction AS vxid, locktype AS lock type,
       mode AS lock mode, granted,
       CASE
                WHEN virtualxid IS NOT NULL AND transactionid IS NOT NULL
                       virtualxid | | ' | | transactionid
                WHEN virtualxid::text IS NOT NULL
                THEN virtualxid
                ELSE transactionid::text
        END AS xid lock, relname,
        page, tuple, classid, objid, objsubid
FROM
       pg locks LEFT OUTER JOIN pg class ON (pg locks.relation = pg class.oid)
       -- do not show our view's locks
WHERE
        pid != pg backend pid() AND
        -- no need to show self-vxid locks
        virtualtransaction IS DISTINCT FROM virtualxid
-- granted is ordered earlier
ORDER BY 1, 2, 5 DESC, 6, 3, 4, 7;
CREATE VIEW
```

Create View lockview I

Create View lockview2

Create and Populate Table lockdemo

```
CREATE TABLE lockdemo (col int);
CREATE TABLE

INSERT INTO lockdemo VALUES (1);
INSERT 0 1
```

Explicit ACCESS SHARE Locking

Explicit ACCESS SHARE Locking

Future slides will only show lockview2 if it contains useful information.

Implicit ACCESS SHARE Locking

```
BEGIN WORK:
REGIN
SELECT * FROM lockdemo;
 col
(1 row)
\! psql -e -c 'SELECT * FROM lockview1;' | sed 's/^/\t/g'
       SELECT * FROM lockview1;
       pid | vxid | lock_type | lock_mode | granted | xid_lock | relname
        11306 | 2/24 | relation | AccessShareLock | t
                                                                        1ockdemo
       (1 row)
COMMIT:
COMMIT
```

Multi-Table ACCESS SHARE Locking

```
BEGIN WORK;
BEGIN

SELECT pg_class.oid
FROM pg_class JOIN pg_namespace ON (relnamespace = pg_namespace.oid)
JOIN pg_attribute ON (pg_class.oid = pg_attribute.attrelid)

LIMIT 1;
oid
----
112
(1 row)
```

Multi-Table ACCESS SHARE Locking

```
\! psql -e -c 'SELECT * FROM lockview1;' | sed 's/^/\t/g'
       SELECT * FROM lockview1;
              | vxid | lock type
                                      lock mode
                                                   granted | xid_lock
